ABSTRACT: Health has been defined as the capability of the organism to adapt to challenges. In this study, we tested to what extent comprehensively phenotyped individuals reveal differences in metabolic responses to a standardized mixed meal tolerance test (MMTT) and how these responses change when individuals experience moderate weight loss. Metabolome analysis was used in 70 healthy individuals, with profiling of ~300 plasma metabolites during an MMTT over 8 h. Multivariate analysis of plasma markers of fatty acid catabolism identified 2 distinct metabolotype clusters (A and B). Individuals from metabolotype B showed slower glucose clearance, had increased intra-abdominal adipose tissue mass and higher hepatic lipid levels when compared with individuals from metabolotype A. An NMR-based urine analysis revealed that these individuals also to have a less healthy dietary pattern. After a weight loss of ~5.6 kg over 12 wk, only the subjects from metabolotype B showed positive changes in the glycemic response during the MMTT and in markers of metabolic diseases. Our study in healthy individuals demonstrates that more comprehensive phenotyping can reveal discrete metabolotypes with different outcomes in a dietary intervention and that markers of lipid catabolism in plasma could allow early detection of the metabolic syndrome.—Fiamoncini, J., Rundle, M., Gibbons, H., Thomas, L., Geillinger-Kästle, K., Bunzel, D., Trezzi, J-P., Kiselova-Kaneva, Y., Wopereis, S., Wahrheit, J., Kulling, S. THE HABIT CHALLENGE™ SHAKE

To help determine the ratio of carbs, fats, and protein that may be best for you, you are given a metabolic challenge beverage that is nutritionally equivalent to a large American breakfast. A lab measures indicators in your blood using samples you collected at different points before and after you drank the shake. Your results show us how your body responded to carbs, fats, and protein during the testing process.

Personalized nutrition is fast becoming a reality due to a number of technological, scientific, and societal developments that complement and extend current public health nutrition recommendations. Personalized nutrition tailors dietary recommendations to specific biological requirements on the basis of a person's health status and goals. The biology underpinning these recommendations is complex, and thus any recommendations must account for multiple biological processes and subprocesses occurring in various tissues and must be formed with an appreciation for how these processes interact with dietary nutrients and environmental factors. Therefore, a systems biology-based approach that considers the most relevant interacting biological mechanisms is necessary to formulate the best recommenda-

Literature Mining & Knowledge Capture

Multi-Layer KnowledgeBase

Data Analysis & Visualization

All these elements together make up TNO's Nutritional Systems Toolbox (**NuSyBox**). **NuSyBox** is the core design engine that allows to efficiently capture nutritional knowledge substantiated by literature, as well as to develop science-based intelligent algorithms that can be used to provide personalized advice and predictions

Personalized Advice

Final Advice

Based on the information provided for this specific patient, the following advice is given for the best possible health outcome. This advice is based on the current state of the patient's health and the available evidence. The advice is personalized to the patient's specific characteristics and is intended to provide the most beneficial guidance for their health.

Prognostic Models

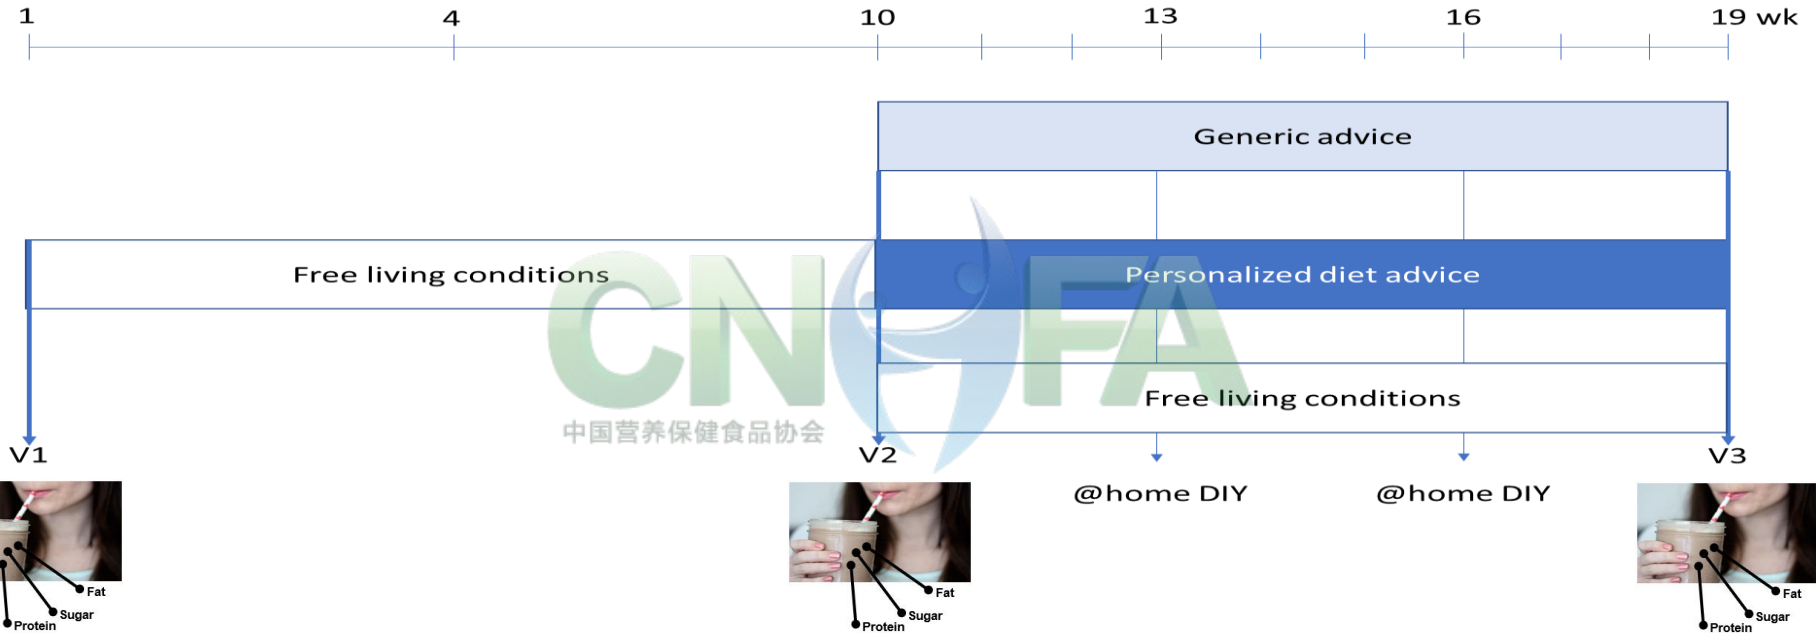

To demonstrate that a healthy or optimal diet in an intervention study can improve “metabolic age” and “metabolic stress”, which are composite biomarkers by quantifying phenotypic flexibility, within a healthy population. These composite markers validate previous findings from other intervention studies using phenotypic flexibility and could be the next generation biomarkers.

中国营养保健食品协会

2 Study design PhenFlex-2 study

To show additional advantages of **personalization** / tailoring of dietary recommendations over general dietary recommendations. PhenFlex-2 delivers the scientific evidence that a healthy diet is beneficial for your health specially when this is tailored to the (nutritional) needs of a person.

So how will nutrition look like in 10 years?

1. It is personal
2. The intervention or advice is based on a diagnosis, i.e. my personal health data.
3. A (science based) model is used to translate diagnosis into advice
4. The model is tailored to specific conditions and goals from a large toolbox
5. The toolbox is continuously and systematically updated with all relevant scientific knowledge
6. Exploit/use information from large numbers of personal health data

Take home message

- › For diagnosis of health effects of nutrition we need resilience markers of health rather than biomarkers of disease
- › The PhenFlex challenge discriminates between different states of health and is superior to measurements in fasted state to quantify health effects of nutrition
- › Only subjects with reduced metabolic resilience in healthy range of population show improved health
- › Subgroups of DT2 patients have a personal response to nutritional interventions
- › In this way we can quantify subtle personal health effects of nutrition!
